

Handout 3: Stochastic gradient descent

Lecturer & author: Georgios P. Karagiannis

georgios.karagiannis@durham.ac.uk

Aim. To introduce the stochastic gradient descent (motivation, description, practical tricks, analysis in the convex scenario, and implementation).

1. MOTIVATIONS FOR STOCHASTIC GRADIENT DESCENT

Problem 1. Consider a learning problem $(\mathcal{H}, \mathcal{Z}, \ell)$. Learning may involve the computation of the minimizer $w^* \in \mathcal{H}$, where \mathcal{H} is a class of hypotheses, of the risk function (RF) $R(w) = \mathbb{E}_{z \sim g}(\ell(w, z))$ given an unknown data generating model $g(\cdot)$ and using a known tractable loss $\ell(\cdot, \cdot)$; that is

$$(1.1) \quad w^* = \arg \min_{w \in \mathcal{H}} (R_g(w)) = \arg \min_{w \in \mathcal{H}} (\mathbb{E}_{z \sim g}(\ell(w, z)))$$

Remark 2. Gradient descent (GD) cannot be directly utilized to address Problem 1 (i.e., minimize the Risk function) because g is unknown, and because (1.1) involves an integral which may be computationally intractable. Instead it aims to minimize the ERF $\hat{R}(w) = \frac{1}{n} \sum_{i=1}^n \ell(w, z_i)$ which ideally is used as a proxy when data size n is big (big-data).

Remark 3. The implementation of GD may be computationally impractical even in problems where we need to minimize an ERF $\hat{R}_n(w)$ if we have big data ($n \approx \text{big}$). This is because GD requires the recursive computation of the exact gradient $\nabla \hat{R}_n(w) = \frac{1}{n} \sum_{i=1}^n \nabla \ell(w, z_i)$ using all the data $\{z_i\}$ at each iteration. That may be too slow.

Remark 4. Stochastic gradient descent (SGD) aims at solving (1.1), and overcoming the issues in Remarks 2 & 3 by using an unbiased estimator of the actual gradient (or some sub-gradient) based on a sample properly drawn from g .

2. STOCHASTIC GRADIENT DESCENT

2.1. Description.

Notation 5. For the sake of notation simplicity and generalization, we present Stochastic Gradient Descent (SGD) in the following minimization problem

$$(2.1) \quad w^* = \arg \min_{w \in \mathcal{H}} (f(w))$$

where here $f : \mathbb{R}^d \rightarrow \mathbb{R}$, and $w \in \mathcal{H} \subseteq \mathbb{R}^d$; $f(\cdot)$ is the unknown function to be minimized, e.g., $f(\cdot)$ can be the risk function $R_g(w) = \mathbb{E}_{z \sim g}(\ell(w, z))$.

Algorithm 6. *Stochastic Gradient Descent (SGD) with learning rate $\eta_t > 0$ for the solution of the minimization problem (2.1)*

For $t = 1, 2, 3, \dots$ iterate:

(1) *compute*

$$(2.2) \quad w^{(t+1)} = w^{(t)} - \eta_t v_t,$$

where v_t is a random vector such that $E(v_t | w^{(t)}) \in \partial f(w^{(t)})$

(2) *terminate if a termination criterion is satisfied, e.g.*

If $t \geq T$ then STOP

Remark 7. If f is differentiable at $w^{(t)}$, it is $\partial f(w^{(t)}) = \{\nabla f(w^{(t)})\}$. Hence v_t is such as $E(v_t | w^{(t)}) = \nabla f(w^{(t)})$ in Algorithm 6 step 1.

Note 8. Assume f is differentiable (for simplicity). To compare SGD with GD, we can re-write (2.2) in the SGD Algorithm 6 as

$$(2.3) \quad w^{(t+1)} = w^{(t)} - \eta_t \left[\nabla f(w^{(t)}) + \xi_t \right],$$

where

$$\xi_t := v_t - \nabla f(w^{(t)})$$

represents the (observed) noise introduced in (2.2) by using a random realization of the exact gradient.

Remark 9. Given T SGD algorithm iterations, the output of SGD can be (but not a exclusively)

(1) the average (after discarding the first few iterations of $w^{(t)}$ for stability reasons)

$$(2.4) \quad w_{\text{SGD}}^{(T)} = \frac{1}{T} \sum_{t=1}^T w^{(t)}$$

(2) or the best value discovered

$$w_{\text{SGD}}^{(T)} = \arg \min_{w_t} \left(f(w^{(t)}) \right)$$

(3) or the last value discovered

$$w_{\text{SGD}}^{(T)} = w^{(T)}$$

Note 10. SGD output converges to a local minimum, $w_{\text{SGD}}^{(T)} \rightarrow w_*$ (in some sense), under different sets of regularity conditions. Section 4 has a brief analysis. To achieve this, Conditions 11 on the learning rate are rather inevitable and should be satisfied.

Condition 11. Regarding the learning rate (or gain) $\{\eta_t\}$ should satisfy conditions

(1) $\eta_t \geq 0$,

(2) $\sum_{t=1}^{\infty} \eta_t = \infty$

$$(3) \sum_{t=1}^{\infty} \eta_t^2 < \infty$$

Remark 12. The popular learning rates $\{\eta_t\}$ in Remark 9 in Handout 2 satisfy Condition 11 and hence can be used in SGD too.

Remark 13. Intuition on Condition 11. Assume that v_t is bounded. Condition 11((3)) aims at reducing the effect of the stochasticity in v_t (introduced noise ξ_t) because it implies $\eta_t \searrow 0$ as $t \rightarrow \infty$, which if it was not the case then

$$w^{(t+1)} - w^{(t)} = -\eta_t v_t \rightarrow 0$$

may not be satisfied and the chain may not converge. Condition 11(2) prevents η_t from reducing too fast and allows the generated chain $\{w^{(t)}\}$ to be able to converge. E.g., after t iterations

$$\begin{aligned} \|w^{(t)} - w^*\| &= \|w^{(t)} - w^{(0)} + w^{(0)} - w^*\| \geq \|w^{(0)} - w^*\| - \|w^{(t)} - w^{(0)}\| \\ &\geq \|w^{(0)} - w^*\| - \sum_{t=0}^{\infty} \|w^{(t+1)} - w^{(t)}\| = \|w^{(0)} - w^*\| - \sum_{t=0}^{T-1} \|\eta_t v_t\| \end{aligned}$$

However if it was $\sum_{t=1}^{\infty} \eta_t < \infty$ it would be $\sum_{t=0}^{\infty} \|\eta_t v_t\| < \infty$ and hence $w^{(t)}$ would never converge to w^* if the seed $w^{(0)}$ is far enough from w^* .

Note 14. Following is a variation of SGD (Algorithm 6) to account for bounded cases such as $w \in \mathcal{H}$.

3. STOCHASTIC GRADIENT WITH PROJECTION

Remark 15. Consider the scenario in Problem 1 where the Risk function is non-convex in \mathbb{R}^d but convex in the restricted hypothesis set \mathcal{H} e.g. $\mathcal{H} = \{w : \|w\| \leq B\}$; hence the learning problem requires to discover w^* in the restricted/bounded set \mathcal{H} . Direct implementation of SGD Algorithm 6 may produce a chain stepping out \mathcal{H} and hence an output $w_{\text{SGD}} \notin \mathcal{H}$. To address this issue, SGD can be modified to include a projection step guarantying $w \in \mathcal{H}$ as in Algorithm 16.

Algorithm 16. *Stochastic Gradient Descent with projection and with learning rate $\eta_t > 0$ for the solution of the minimization problem (2.1)*

For $t = 1, 2, 3, \dots$ iterate:

(1) compute

$$(3.1) \quad w^{(t+\frac{1}{2})} = w^{(t)} - \eta_t v_t,$$

where v_t is a random vector such that $E(v_t | w^{(t)}) \in \partial f(w^{(t)})$

(2) compute

$$(3.2) \quad w^{(t+1)} = \arg \min_{w \in \mathcal{H}} (\|w - w^{(t+\frac{1}{2})}\|)$$

(3) terminate if a termination criterion is satisfied

4. ANALYSIS OF SGD (ALGORITHM 6)

Note 17. Recall that the stochasticity of SGD comes from the stochastic sub-gradient v_t ; hence the expectations below are under these random vectors distributions.

Theorem 18. *Let $f(\cdot)$ be a convex and Lipschitz function. If we run SGD algorithm of f with learning rate $\eta_t > 0$ for T steps, the output $w_{\text{GD}}^{(T)} = \frac{1}{T} \sum_{t=1}^T w^{(t)}$ satisfies*

$$(4.1) \quad \mathbb{E} \left(f \left(w_{\text{GD}}^{(T)} \right) \right) - f(w^*) \leq \frac{\|w^*\|^2}{2\eta} + \frac{\eta}{2} \sum_{t=1}^T \mathbb{E} \|v_t\|^2$$

Proof. Let $v_{1:t} = (v_1, \dots, v_t)$. By Jensens' inequality (or see (4.3) in Handout 2)

$$(4.2) \quad \mathbb{E} \left(f \left(w_{\text{GD}}^{(T)} \right) - f(w^*) \right) \leq \mathbb{E} \left(\frac{1}{T} \sum_{t=1}^T \left(f(w^{(t)}) - f(w^*) \right) \right) = \frac{1}{T} \sum_{t=1}^T \mathbb{E} \left(f(w^{(t)}) - f(w^*) \right)$$

I will try to use Lemma 22 from Handout 2, hence I need to show

$$(4.3) \quad \mathbb{E} \left(f(w^{(t)}) - f(w^*) \right) \leq \mathbb{E} \left(\langle w^{(t)} - w^*, v_t \rangle \right)$$

where the expectation is under $v_{1:T}$. It is

$$\begin{aligned} \mathbb{E}_{v_{1:T}} \left(\langle w^{(t)} - w^*, v_t \rangle \right) &= \mathbb{E}_{v_{1:t}} \left(\langle w^{(t)} - w^*, v_t \rangle \right) \\ &= \mathbb{E}_{v_{1:t-1}} \left(\mathbb{E}_{v_{1:t}} \left(\langle w^{(t)} - w^*, v_t \rangle | v_{1:t-1} \right) \right) \quad (\text{law of total expectation}) \end{aligned}$$

But $w^{(t)}$ is fully determined by $v_{1:t-1}$, (see (2.2)) so

$$\mathbb{E}_{v_{1:t-1}} \left(\mathbb{E}_{v_{1:t}} \left(\langle w^{(t)} - w^*, v_t \rangle | v_{1:t-1} \right) \right) = \mathbb{E}_{v_{1:t-1}} \left(\langle w^{(t)} - w^*, \mathbb{E}_{v_{1:t}} (v_t | v_{1:t-1}) \rangle \right)$$

As $w^{(t)}$ is fully determined by $v_{1:t-1}$ then $\mathbb{E}_{v_{1:t}} (v_t | v_{1:t-1}) = \mathbb{E}_{v_{1:t}} (v_t | w^{(t)}) \in \partial f(w^{(t)})$, hence $\mathbb{E}_{v_{1:t}} (v_t | v_{1:t-1})$ is a sub-gradient. By sub-gradient definition

$$(4.4) \quad \begin{aligned} \mathbb{E}_{v_{1:t-1}} \left(\langle w^{(t)} - w^*, \mathbb{E}_{v_{1:t}} (v_t | v_{1:t-1}) \rangle \right) &\geq \mathbb{E}_{v_{1:t-1}} \left(f(w^{(t)}) - f(w^*) \right) \\ &= \mathbb{E}_{v_{1:T}} \left(f(w^{(t)}) - f(w^*) \right) \end{aligned}$$

Hence combining (4.4), (4.3), and (4.3)

$$\mathbb{E} \left(f \left(w_{\text{GD}}^{(T)} \right) - f(w^*) \right) \leq \frac{1}{T} \sum_{t=1}^T \mathbb{E} \left(\langle w^{(t)} - w^*, v_t \rangle \right)$$

Lemma 22 from Handout 2

$$\mathbb{E} \left(f \left(w_{\text{GD}}^{(T)} \right) - f(w^*) \right) \leq \frac{\mathbb{E} \|w^*\|^2}{2\eta} + \frac{\eta}{2} \sum_{t=1}^T \mathbb{E} \|v_t\|^2$$

□

Remark 19. Note that the upper bound in (4.1) depends on the variation of v_t as

$$(4.5) \quad \mathbb{E} \|v_t\|^2 = \sum_{j=1}^d \text{Var}(v_{t,j}) + \sum_{j=1}^d (\mathbb{E}(v_{t,j}))^2$$

where d is the dimension of $v_t = (v_{t,1}, \dots, v_{t,d})$.

Proposition 20. *Let $f(\cdot)$ be a convex and Lipschitz function, and let $\mathcal{H} = \{w \in \mathbb{R} : \|w\| \leq B\}$. Assume we run SGD algorithm of $f(\cdot)$ with learning rate $\eta_t = \sqrt{\frac{B^2}{\rho^2 T}}$ for T steps, and output $w_{\text{SGD}}^{(T)} = \frac{1}{T} \sum_{t=1}^T w^{(t)}$. Then*

(1) *upper bound on the sub-optimality is*

$$(4.6) \quad \mathbb{E} \left(f \left(w_{\text{SGD}}^{(T)} \right) \right) - f(w^*) \leq \frac{B\rho}{\sqrt{T}}$$

(2) *a given level off accuracy ε such that $\mathbb{E} \left(f \left(w_{\text{SGD}}^{(T)} \right) \right) - f(w^*) \leq \varepsilon$ can be achieved after T iterations*

$$T \geq \frac{B^2 \rho^2}{\varepsilon^2}.$$

Solution. Part 1 is a simple substitution from Proposition 28, and part 2 is implied from part 1.
